# The basic model

# THE BASIC “BEFORE AND AFTER” MODEL

---

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \cdot cartel + \varepsilon$$

Coefficient of interest:  
captures overcharge level  
specifically due to  
anticompetitive practices

# THE BASIC “BEFORE AND AFTER” MODEL

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \cdot cartel + \varepsilon$$

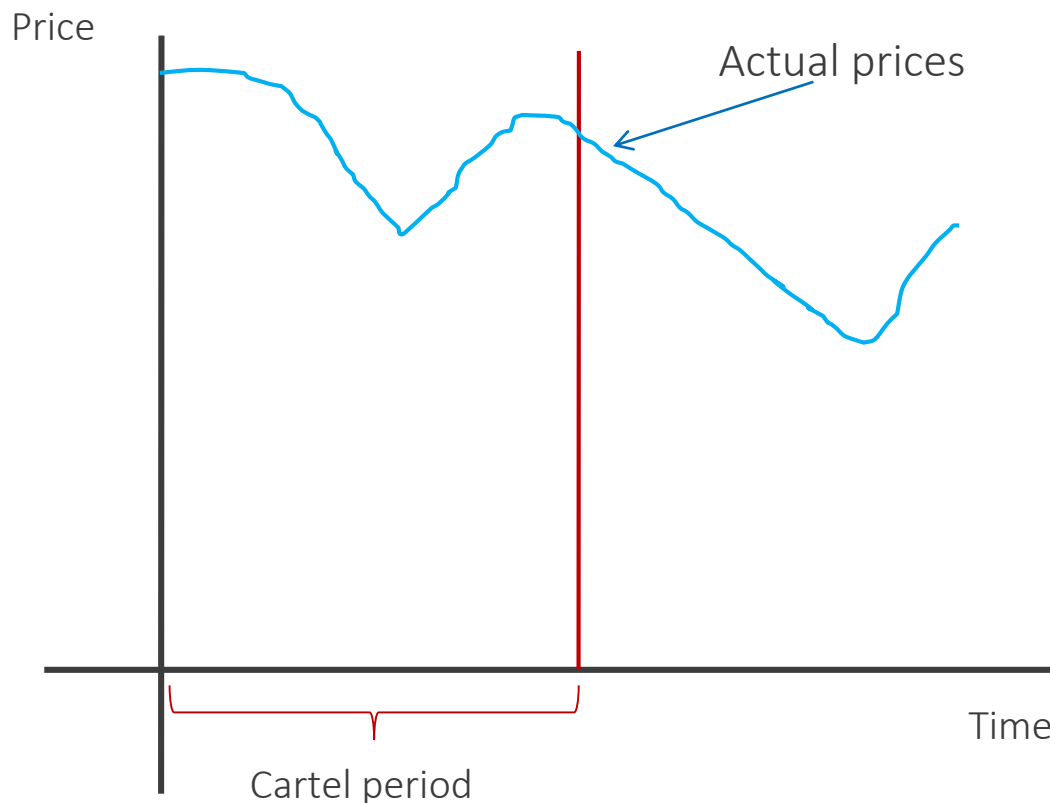

$$\lambda > 0$$

$$cartel = \begin{cases} 1 & \text{cartel period} \\ 0 & \text{outside the cartel period} \end{cases}$$

# THE BASIC “BEFORE AND AFTER” MODEL

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \text{ cartel} + \varepsilon$$

$$\lambda > 0$$

# THE BASIC “BEFORE AND AFTER” MODEL

$$\text{Price} = \alpha + \beta \cdot \text{supply} + \gamma \cdot \text{demand} + \lambda \text{ cartel} + \varepsilon$$

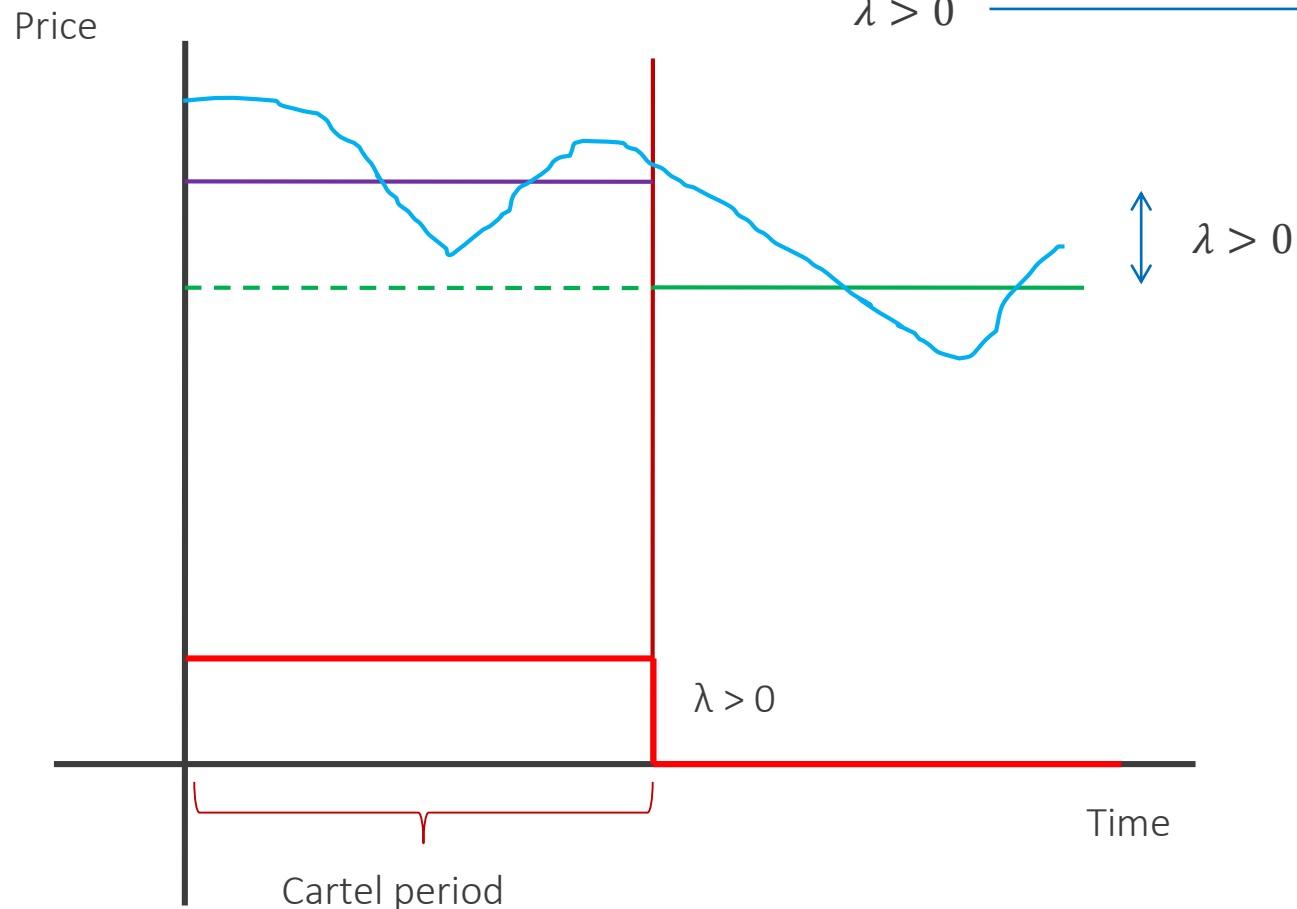

$$\lambda > 0$$

# THE BASIC “BEFORE AND AFTER” MODEL

$$\text{Price} = \alpha + \beta \cdot \text{supply} + \gamma \cdot \text{demand} + \lambda \text{ cartel} + \varepsilon$$

$$\lambda > 0$$

# Statistical significance

# THE BASIC “BEFORE AND AFTER” MODEL

$$\text{Price} = \alpha + \beta \cdot \text{supply} + \gamma \cdot \text{demand} + \lambda \text{ cartel} + \varepsilon$$

$$\lambda > 0$$

No overcharge  
under  
standard statistical confidence  
criteria

# STATISTICAL SIGNIFICANCE

- The regression model provides estimates of the effect of the Infringement on prices (i.e. point estimates) and the statistical significance of these point estimates.

$\lambda$  Point estimate  
It is the best estimate of the impact of the Infringement on prices

Negative, statistically significant

\* Weakly statistically significant

\*\* Statistically significant

Negative, not statistically significant

\*\*\* Highly statistically significant

Positive, not statistically significant

# STATISTICAL SIGNIFICANCE

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \text{ cartel} + \varepsilon$$

$$\lambda > 0$$

No overcharge  
under  
standard statistical  
confidence  
criteria

# STATISTICAL SIGNIFICANCE GAMES

**What is the right confidence interval?**

- Data considerations
- Appropriate presumptions

# STATISTICAL SIGNIFICANCE GAMES

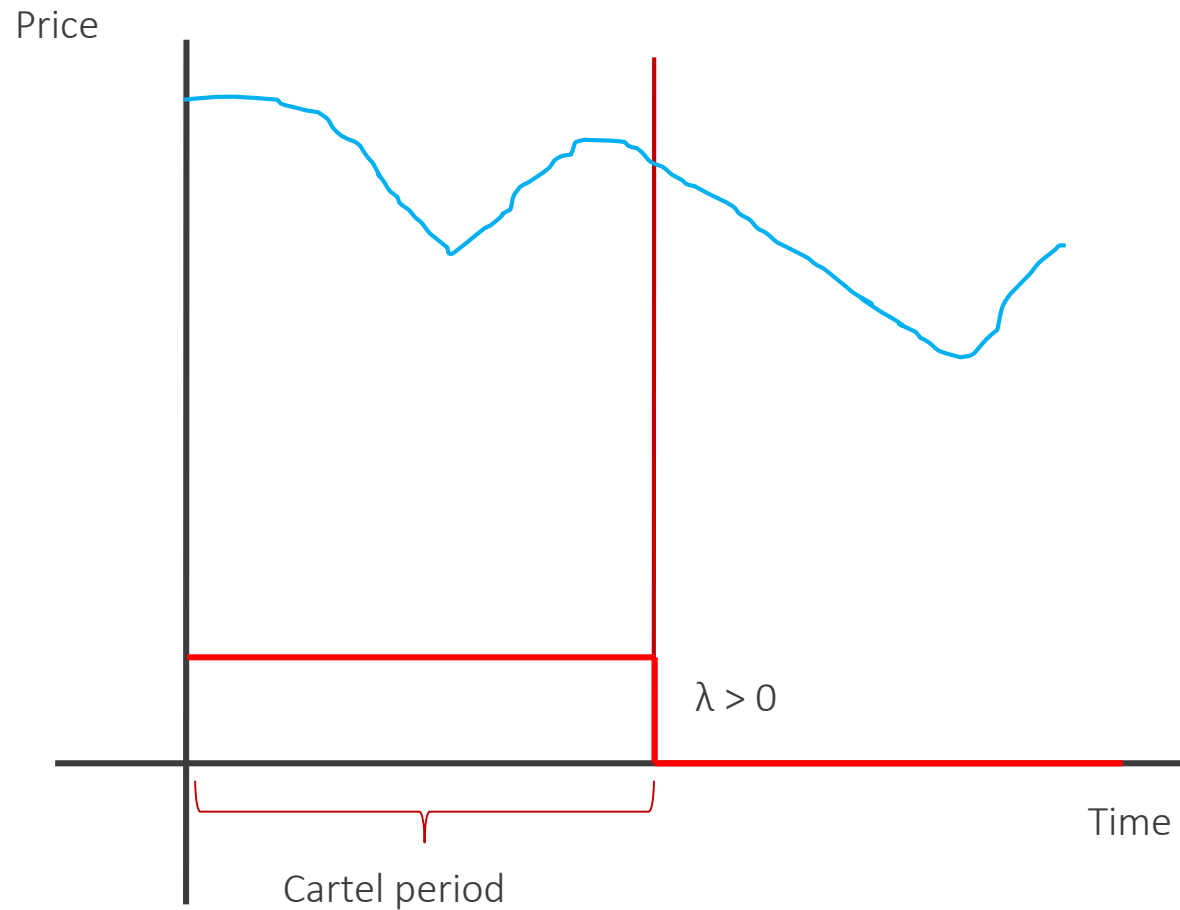

**Positive overcharge  
under  
standard statistical  
confidence  
criteria**

# Trend manipulations

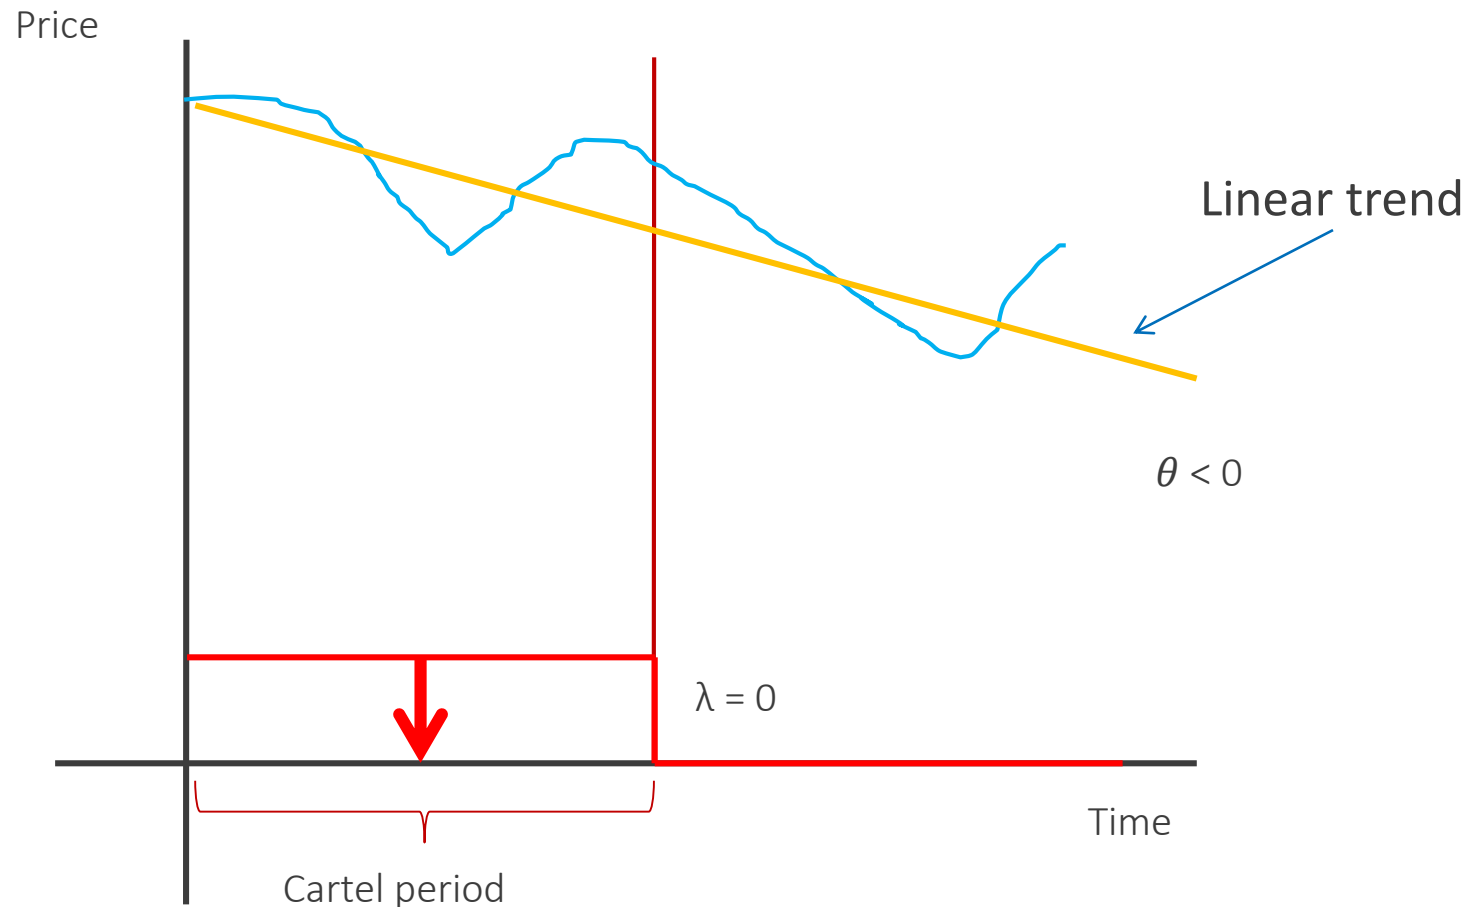

# PLAYING WITH TRENDS

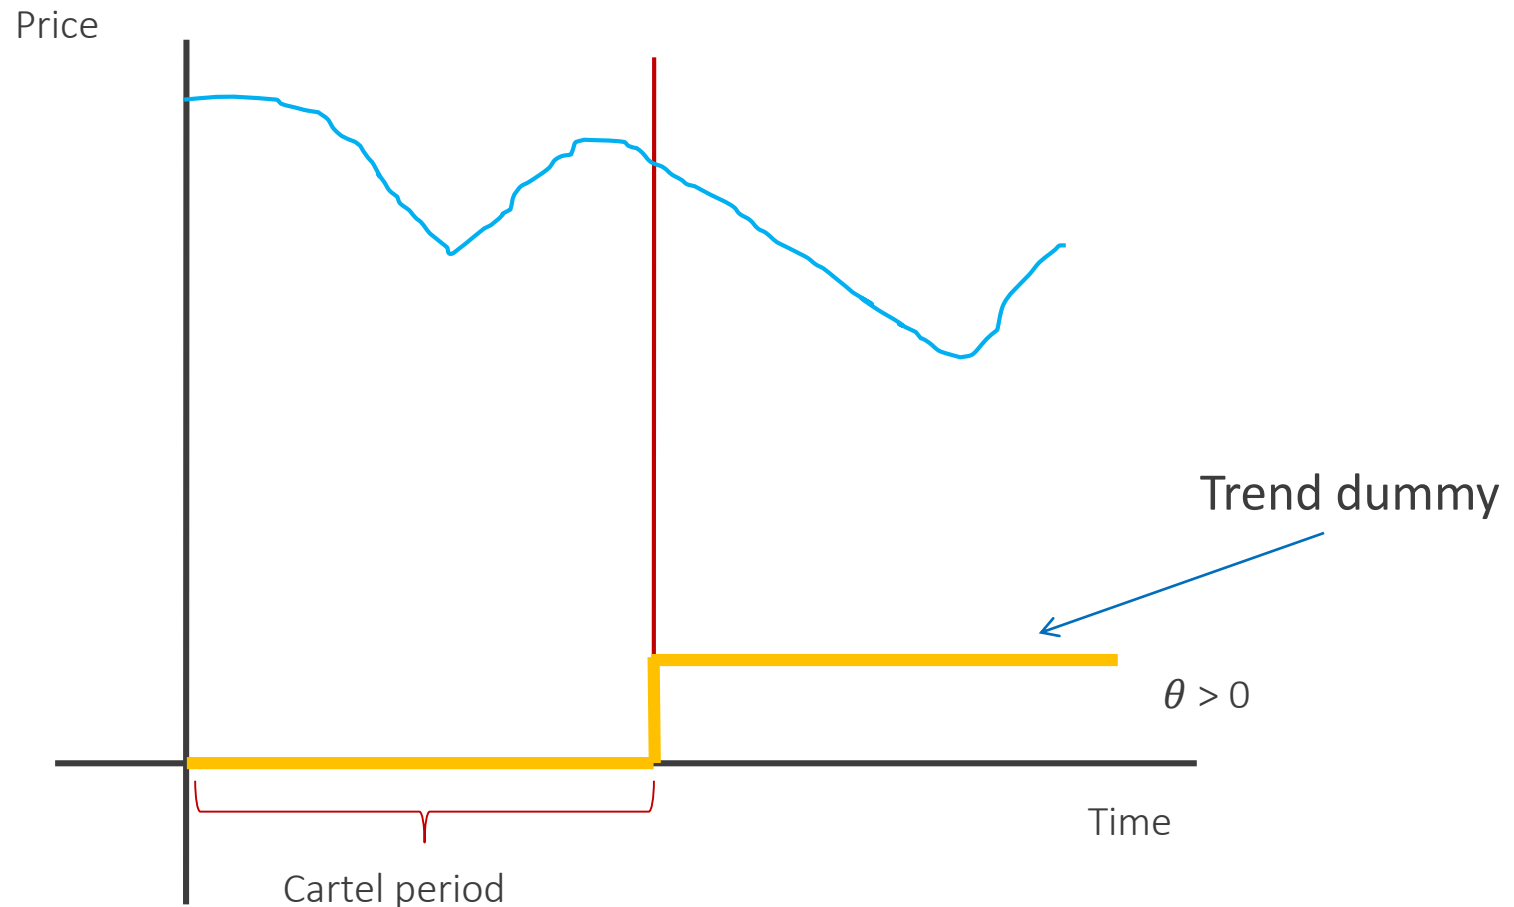

# PLAYING WITH TRENDS TO REDUCE THE OVERCHARGE

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \cdot cartel + \theta \cdot linear\ trend + \varepsilon$$

# PLAYING WITH TRENDS TO REDUCE THE OVERCHARGE

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \cdot cartel + \theta \cdot trend\ dummy + \varepsilon$$

# PLAYING WITH TRENDS TO REDUCE THE OVERCHARGE

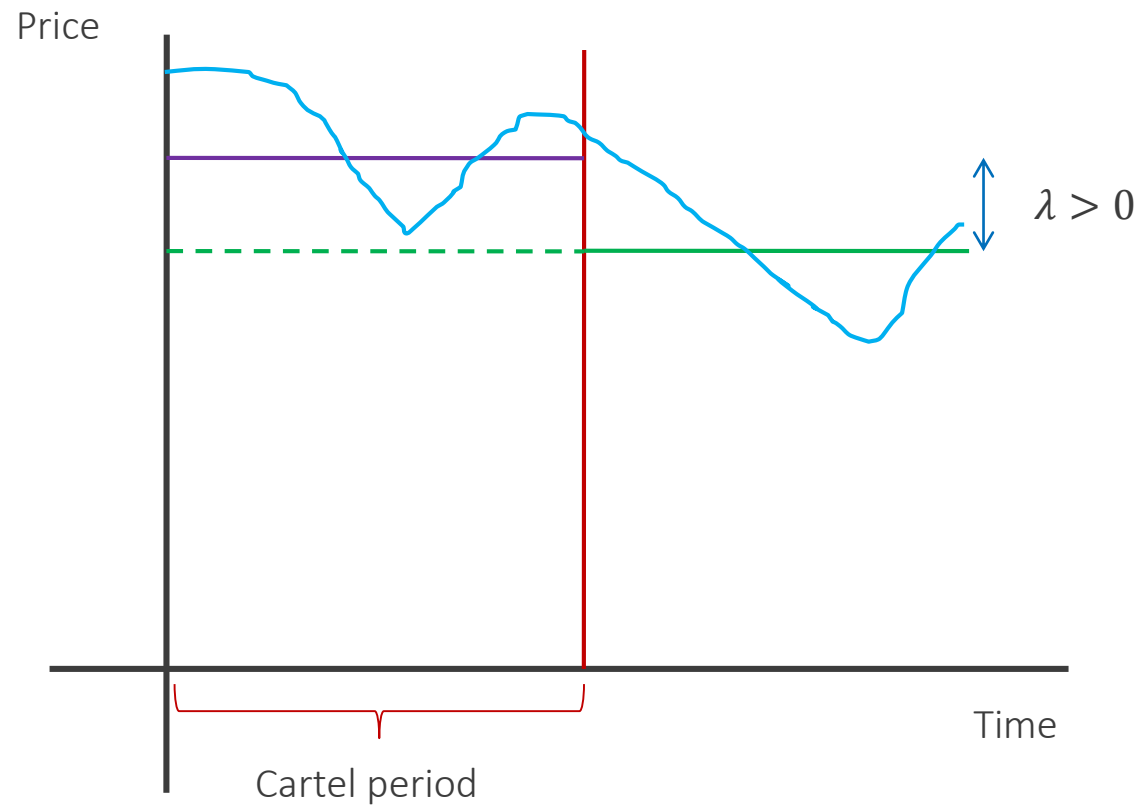

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \lambda \cdot cartel + \theta \cdot trend\ dummy + \varepsilon$$

# Playing with the cartel period

# PLAYING WITH THE CARTEL PERIOD

# PLAYING WITH THE CARTEL PERIOD

# Back-casting tricks

# BACK-CASTING MODEL

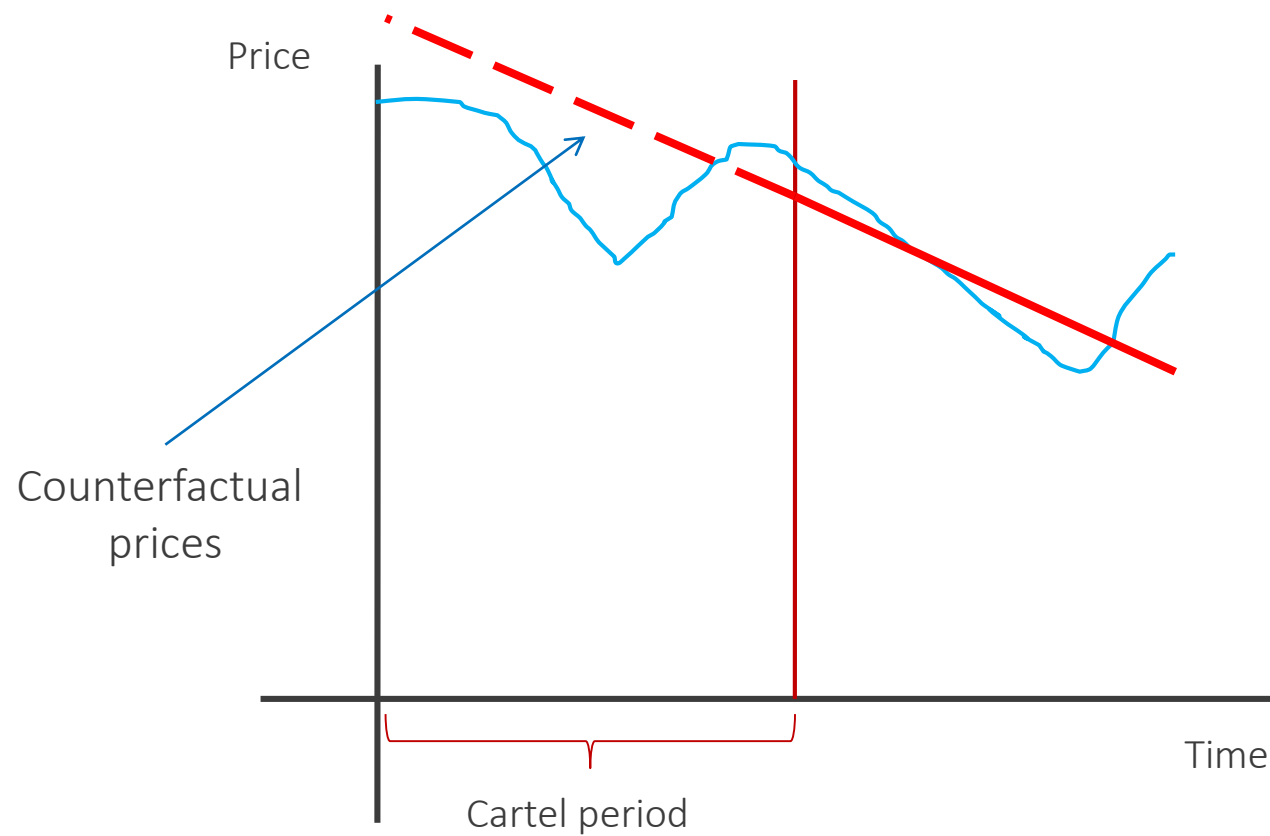

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \varepsilon$$

# BACK-CASTING MODEL

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \varepsilon$$

# BACK-CASTING MODEL PRODUCES ABSURD RESULTS

$$Price = \alpha + \beta \cdot supply + \gamma \cdot demand + \varepsilon$$

# Conclusions

# CONCLUSIONS

---

- Economists play games to increase or decrease the overcharge
- Same occurs with the pass-through rate
- These tricks can be spotted
- ... in cross examination
- ... and during a hot tub session
- Judges should reward honest experts and punish those that play tricks

### Assessing Damages in (Input) Price Fixing Cases

Enrique Andreu, Jorge Padilla and Nadine Watson<sup>1</sup>

*According to the law of nature it is only fair that no one should become richer through damages and injuries suffered by another - Marcus Tullius Cicero*

Cartel damages in price fixing cases are typically calculated by estimating the difference between the cartel's price and the price that would have existed absent the cartel (i.e., in a counterfactual or *but for* world without price fixing) and multiplying that difference, or per-unit price overcharge, by the number of units purchased by direct purchasers. In some jurisdictions, when the cartel affects the price of an input which is used to manufacture products sold to final consumers, this measure of overcharge is adjusted downwards to reflect the fact that part of the price overcharge is passed through to final consumers (who are indirect purchasers of the cartelized product).

This approach is likely to underestimate the true harm caused by price fixing, especially when the cartel affects an intermediate goods industry. This is for two reasons.

- First, as shown by Basso and Ross (2010),<sup>2</sup> the overcharge measure is likely to underestimate the harm caused by a cartel on direct and indirect purchasers as it omits potentially significant volume effects.
- Second, the standard approach to estimating the magnitude of the price impact of a cartel is also likely to lead to too low estimates of the cartel overcharge. Economists typically compare observed prices "during" the cartel period with the prices observed in periods "before" and "after" the cartel. They measure the price overcharge as the difference between the average price observed in the cartel period and the average price observed before and after the cartel period, provided that such a difference is (a) statistically significant and (b) is not caused by factors other than the cartel (so-called *confounding factors*). However, the use of standard statistical significance criteria may lead economists to conclude that the cartel may not have had a material effect on prices, when in fact the opposite is true. Furthermore, the use of multiple regression analysis to control for confounding factors may be misused to produce economically and statistically insignificant estimates of the price overcharge.

<sup>1</sup> The authors are economists at CompassLexecon. This essay was prepared for presentation at the Concurrences' conference "New Frontiers of Antitrust" held in Paris on 11<sup>th</sup> February 2011. The usual caveats apply.
